### **NEW QUESTION: 2**

You are planning a streaming data solution that will use Azure Databricks. The solution will stream sales transaction data from an online store. The solution has the following specifications:

The output data will contain items purchased, quantity, line total sales amount, and line total tax amount.

Line total sales amount and line total tax amount will be aggregated in Databricks.

Sales transactions will never be updated. Instead, new rows will be added to adjust a sale.

You need to recommend an output mode for the dataset that will be processed by using Structured Streaming. The solution must minimize duplicate data.

What should you recommend?

- A. Update
- B. Complete
- C. Append

**Answer: C**

Explanation:

Append Mode: Only new rows appended in the result table since the last trigger are written to external storage. This is applicable only for the queries where existing rows in the Result Table are not expected to change.

### **NEW QUESTION: 3**

One way to determine control effectiveness is by determining:

- A. the evaluation and analysis of reliability.
- B. whether it is preventive, detective or compensatory.
- C. the test results of intended objectives.
- D. the capability of providing notification of failure.

**Answer: C**

Explanation:

Control effectiveness requires a process to verify that the control process worked as intended. Examples such as dual-control or dual-entry bookkeeping provide verification and

assurance that the process operated as intended. The type of control is not relevant, and notification of failure is not determinative of control strength. Reliability is not an indication of control strength; weak controls can be highly reliable, even if they are ineffective controls.
