You can use Azure Machine Learning to deploy a GPU-enabled
model as a web service. Deploying a model on Azure Kubernetes
Service (AKS) is one option. The AKS cluster provides a GPU
resource that is used by the model for inference.
Inference, or model scoring, is the phase where the deployed
model is used to make predictions. Using GPUs instead of CPUs
offers performance advantages on highly parallelizable
computation.

NEW QUESTION: 2
Oracle Grid Infrastructure for a stand-alone server is
installed on your production host before installing the Oracle
Database server. The database and listener are configured by
using Oracle Restart.
Examine the following command and its output:
$ crsctl config has
CRS-4622: Oracle High Availability Services auto start is
enabled.
What does this imply?
A. When a database instance is started by using the SRVCTL
utility and listener startup fails, the instance is still
started.
B. When you start an instance on a high with SQL *Plus
dependent listeners and ASM disk groups are automatically
started.
C. When a database is created by using SQL* Plus, it is
automatically added to the Oracle Restart configuration.
D. When you create a database service by modifying the
SERVICE_NAMES initialization parameter, it is automatically
added to the Oracle Restart configuration.

Answer: A

Explanation:
About Startup Dependencies
Oracle Restart ensures that Oracle components are started in
the proper order, in accordance with component
dependencies. For example, if database files are stored in
Oracle ASM disk groups, then before starting the database

instance, Oracle Restart ensures that the Oracle ASM instance
is started and the required disk groups are mounted.
Likewise, if a component must be shut down, Oracle Restart
ensures that dependent components are cleanly shut
down first.
Oracle Restart also manages the weak dependency between
database instances and the Oracle Net listener (the
listener): When a database instance is started, Oracle Restart
attempts to start the listener. If the listener startup fails,
then the database is still started. If the listener later
fails, Oracle Restart does not shut down and restart any
database
instances.

You want to use Amazon Redshift and you are planning to deploy
dw1.8xlarge nodes. What is the minimum amount of nodes that you
need to deploy with this kind of configuration?
A. 0
B. 1
C. 2
D. 3
Answer: B
Explanation:

Explanation:
For a single-node configuration in Amazon Redshift, the only
option available is the smallest of the two options. The 8XL
extra-large nodes are only available in a multi-node
configuration
