NEW QUESTION: 3
Which of the following statements pertaining to block ciphers
is incorrect?
A. Plain text is encrypted with a public key and decrypted with
a private key.
B. It operates on fixed-size blocks of plaintext.
C. Some Block ciphers can operate internally as a stream.
D. It is more suitable for software than hardware
implementations.
Answer: A
Explanation:
Explanation/Reference:
Block ciphers do not use public cryptography (private and
public keys).
Block ciphers is a type of symmetric-key encryption algorithm
that transforms a fixed-size block of plaintext (unencrypted
text) data into a block of ciphertext (encrypted text) data of
the same length. They are appropriate for software
implementations and can operate internally as a stream. See
more info below about DES in Output Feedback Mode (OFB), which
makes use internally of a stream cipher.
The output feedback (OFB) mode makes a block cipher into a
synchronous stream cipher. It generates keystream blocks, which
are then XORed with the plaintext blocks to get the ciphertext.
Just as with other stream ciphers, flipping a bit in the
ciphertext produces a flipped bit in the plaintext at the same
location.
This property allows many error correcting codes to function
normally even when applied before encryption.
