NEW QUESTION: 1

The Product Mapping view of the Service-Oriented Integration architecture shows some of the Oracle products mapped onto two or more layers in the architecture. For example, Oracle WebLogic Suite (OWLS) is mapped to the Business Service Layer, the Data Normalization Layer, and the Connectivity Layer. Which statement best describes why OWLS is mapped to these three layers in the OSI architecture?

- A.** The other Oracle product mapped to the three layers all have OWLS embedded in the product. Thus, OWLS is required for the products mapped into three layers.
- B.** OWLS is the only product that provides all the capabilities required by the three layers in the OSI architecture.
- C.** OWLS can be used to host assets delivering the capabilities in any or all of the three layers. Assets hosted on OWLS should

still adhere to the layering of the architect.

D. When OWLS is used to implement the OSI architecture, the three layers need to be combined into a single architectural layer.

E. OWLS plus the other Oracle products that are mapped to the three layers are required to deliver the capabilities for the three layers in the architecture.

Answer: A

Explanation:

OPSS is incorporated into OWLS which ties the entire Service Tier into the enterprise security architecture.

The OWC provides the majority of the capabilities required for a modern user

interface. OWC provides some higher-level Connectivity capabilities (e.g. connectivity

to content management systems, WSRP). OWLS provides the base Connectivity (e.g.

JDBC, JCA) to connect to the Resource Tier.

Note: Oracle WebLogic Suite (OWLS) - fully implements the latest Java EE standards,

provides industry leading reliability and performance, and includes

comprehensive management capabilities. OWLS can be used to host the Oracle

WebCenter products.

NEW QUESTION: 2

A. Option A

B. Option B

C. Option C

D. Option D

Answer: A

Explanation:

Windows Server 2012 includes an iSCSI Target role that, along with Failover Clustering, allows it to become a cost-effective and highly-available iSCSI Storage Array.

We can connect from our Hyper-V host to the iSCSI target on the storage array with the following PowerShell command line:

```
New-IscsiTargetPortal -TargetPortalAddress <IP_Address or FQDN of storage array>
```

```
$target = Get-IscsiTarget
```

```
Connect-IscsiTarget -NodeAddress $target.NodeAddress
```

Incorrect: Not B: Discovery Domains in an iSCSI fabric, like zones in a Fibre Channel fabric, enable you to partition the storage resources in your storage area network (SAN). By creating and managing Discovery Domains, you can control the iSCSI targets that each iSCSI initiator can see and log on to.

Reference: Configure iSCSI Target Server Role on Windows Server 2012 You have a server that runs Windows Server 2012 R2.
