NEW QUESTION: 1

Which of the following is a valid IP address for a host in a network with a 10.0.0.0/24 subnet mask?

- A. CoPP
- B. NBAR
- C. NetFlow
- D. SNMP

Answer: B

NEW QUESTION: 2

You need to deploy Azure Kubernetes Service (AKS) to host an application. The solution must meet the following requirements:

- * Containers must only be published internally.
- * AKS clusters must be able to create and manage containers in Azure.

What should you use for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation

Box 1: Azure Container Registry

Azure services like Azure Container Registry (ACR) and Azure Container Instances (ACI) can be used and connected from independent container orchestrators like kubernetes (k8s). You can set up a custom ACR and connect it to an existing k8s cluster to ensure images will be pulled from the private container registry instead of the public docker hub.

Box 2: An Azure service principal

When you're using Azure Container Registry (ACR) with Azure Kubernetes Service (AKS), an authentication mechanism needs to be established. You can set up AKS and ACR integration during the initial creation of your AKS cluster. To allow an AKS cluster to interact with ACR, an Azure Active Directory service principal is used.
