C. ãf-ãf-ã, ,ã,§ã, -ãf^ã•®çµ, ä°†

D. ãf-ãf-ã, ,ã,§ã, -ãf^ã•®é-<å§<

Answer: D

NEW QUESTION: 2

A midrange plan can be executed in

A. two years.

B. nine months.

C. four years.

D. six months.

Answer: A

Explanation:

Explanation: According to conventional business wisdom, a midrange plan can be executed in two years. The typical formulation is that shortrange plans can be achieved in from six months to a year, midrange plans can be achieved in between one and three years, and longrange plans can be accomplished in three to five years. Most business experts assert that it is not worthwhile to plan much longer than five years in advance, because of the volatility and constant flux of the marketplace.

NEW QUESTION: 3

A mid-sized business has a data center that uses virtualization to host services for subscribers. An HP sales professional is proposing a solution for this data center, and the conversation has turned to security. The customer states that visualization already isolates OSs from each other and wonders why the data center would need a special solution to provide extra security. What should the sales professional explain about the particular security needs of virtualized environments? (Select two.)

A. Hypervisors, which manage workloads for multiple virtual server instances, make a valuable and vulnerable target for hackers

B. Although virtual switches (vSwitches) support many of the same security features as traditional switches they require a management system to deploy them and activate the correct features dynamically

C. Because the virtual services share a physical machine, when one is infected with a virus, all other instances on that machine are infected as well.

D. Traffic between virtual server Instances might never cross the physical wire, making it difficult to filter the traffic with traditional solutions.

E. Virtual servers cannot be patched as easily and automatically as non-virtual servers so they make a vulnerable target

Answer: A,D

Explanation:

A: For efficiency in communications between virtual machines (VMs), most virtualization platforms include the ability to create software-based virtual networks and switches inside of the physical host to enable VMs to communicate directly. This traffic will not be visible to network-based security protection devices, such as network-based intrusion prevention systems.

Gartner recommends that at a minimum, organizations require the same type of monitoring they place on physical networks, so that they don't lose visibility and control when workloads and networks are virtualized.

D: Given the privileged level that the hypervisor/VMM holds in the stack, hackers have already begun targeting this layer to potentially compromise all the workloads hosted above it. From an IT security and management perspective, this layer must be patched, and configuration guidelines must be established.

Note:Risk: Adequate controls on administrative access to the Hypervisor/VMM layer and to administrative tools are lacking. Because of the critical support the hypervisor/VMM layer provides, administrative access to this layer must be tightly controlled, but this is complicated by the fact that most virtualization platforms provide multiple paths of administration for this layer. Gartner recommends restricting access to the virtualization layer as with any sensitive OS and favoring virtualization platforms that support role-based access control of administrative responsibilities to further refine who can do what within the virtual environment. Where regulatory and/or compliance requirements dictate, organizations should evaluate the need for third-party tools to provide tight administrative control.
